################################

§1 Introduction to Deep Learning in Python

§1.3 Building deep learning models with keras
```

1 Creating a keras model

1.What are the model-building steps?

- The Keras workflow has four steps:
  - specify Architecture
  - compile
  - fit
  - predict

2. Code of model specification:

[1]:
```
import numpy as np
from keras.layers import Dense
from keras.models import Sequential

predictors = np.loadtxt('ref1. Hourly wages predictors data.csv',
                        delimiter=',')
n_cols = predictors.shape[1]

model = Sequential()
model.add(Dense(100, activation='relu', input_shape=(n_cols, )))
model.add(Dense(100, activation='relu'))
model.add(Dense(1))
```

3. Practice question for understanding the data:

- It will be started soon to building models in Keras to predict wages based on various professional and demographic factors by the next steps. Before starting building a model, it's good to understand the data by performing some exploratory analysis.
- It is recommended to use the `.head()` and `.describe()` methods in the IPython Shell to quickly overview the DataFrame.
- The target variable which will be predicting is `wage_per_hour`. Some of the predictor variables are binary indicators, where a value of `1` represents `True`, and `0` represents `False`.
- Of the nine predictor variables in the DataFrame, how many are binary indicators? The min and max values, as shown by `.describe()` will be informative here. How many binary indicator predictors are there?

  ☐ 0.

  ☐ 5.

  ☒ 6.

▶ Package pre-loading:

[2]:
```
import pandas as pd
```

▶ Data pre-loading:

[3]:
```
df = pd.read_csv('ref2. Hourly wages.csv')
```

▶ Question-solving method:

[4]:
```
df.head()
```

[4]:

	wage_per_hour	union	education_yrs	experience_yrs	age	female	marr	south	manufacturing	construction
0	5.10	0	8	21	35	1	1	0	1	0
1	4.95	0	9	42	57	1	1	0	1	0
2	6.67	0	12	1	19	0	0	0	1	0
3	4.00	0	12	4	22	0	0	0	0	0
4	7.50	0	12	17	35	0	1	0	0	0

[5]:
```
df.describe()
```

[5]:

	wage_per_hour	union	education_yrs	experience_yrs	age

max       1.000000    1.000000    1.000000       1.000000      1.000000
```

[6]:
```
cols = df.columns
count = 0
for i in range(len(cols)):
    if ((df.iloc[:, i].unique()[0] in [0, 1])
            and (df.iloc[:, i].unique()[1] in [0, 1])):
        count += 1
    else:
        pass
print('There are {} binary indicator predictors here.'.format(count))
```

```
There are 6 binary indicator predictors here.
```

4. Practice exercises for creating a Keras model:

▶ Package pre-loading:

[7]:
```
import pandas as pd
```

▶ Data pre-loading:

[8]:
```
df = pd.read_csv('ref2. Hourly wages.csv')

target = df.iloc[:, 0].to_numpy()
predictors = df.iloc[:, 1:].to_numpy()
```

▶ Model specifying practice:

[9]:
```
# Import necessary modules
import keras
from keras.layers import Dense
from keras.models import Sequential

# Save the number of columns in predictors: n_cols
```

```
n_cols = predictors.shape[1]

# Set up the model: model
model = Sequential()

# Add the first layer
model.add(Dense(50, activation='relu', input_shape=(n_cols, )))

# Add the second layer
model.add(Dense(32, activation='relu'))

# Add the output layer
model.add(Dense(1))
```

2 Compiling and fitting a model

1. Why is it necessary to compile the model?

- Specify the optimizer:
  - many options and mathematically complex
  - `adam` is usually a good choice
- Loss function:
  - `mean_squared_error` is common for regression

2. Code of compiling a model:

[10]:
```
import numpy as np
from keras.layers import Dense
from keras.models import Sequential

predictors = np.loadtxt('ref1. Hourly wages predictors data.csv',
                        delimiter=',')
n_cols = predictors.shape[1]

model = Sequential()
model.add(Dense(100, activation='relu', input_shape=(n_cols, )))
model.add(Dense(100, activation='relu'))
model.add(Dense(1))
model.compile(optimizer='adam', loss='mean_squared_error')
```

3. What is fitting a model?

- Apply backpropagation and gradient descent with the data to update the weights.
- Scale data before fitting can ease optimization.

4. Code of fitting a model:

[11]:
```
target = np.loadtxt('ref3. Hourly wages target data.csv', delimiter=',')

model.fit(predictors, target)
```

```
17/17 [==============================] - 1s 36ms/step - loss: 40.7357
```

[11]:
```
<tensorflow.python.keras.callbacks.History at 0x7faacb552950>
```

5. Practice exercises for compiling and fitting a model:

▶ Package pre-loading:

[12]:
```
import pandas as pd
```

▶ Data pre-loading:

[13]:
```
df = pd.read_csv('ref2. Hourly wages.csv')

predictors = df.iloc[:, 1:].to_numpy()
```

▶ Model compiling practice:

[14]:
```
# Import necessary modules
import keras
from keras.layers import Dense
from keras.models import Sequential

# Specify the model
n_cols = predictors.shape[1]
model = Sequential()
model.add(Dense(50, activation='relu', input_shape=(n_cols, )))
model.add(Dense(32, activation='relu'))
model.add(Dense(1))

# Compile the model
model.compile(optimizer='adam', loss='mean_squared_error')

# Verify that model contains information from compiling
print("Loss function: " + model.loss)
```

```
Loss function: mean_squared_error
```

▶ Data re-pre-loading:

[15]:
```
target = df.iloc[:, 0].to_numpy()
```

▶ Model fitting practice:

[16]:
```
# Import necessary modules
import keras
```

```
from keras.layers import Dense
from keras.models import Sequential

# Specify the model
n_cols = predictors.shape[1]
model = Sequential()
model.add(Dense(50, activation='relu', input_shape=(n_cols, )))
model.add(Dense(32, activation='relu'))
model.add(Dense(1))

# Compile the model
model.compile(optimizer='adam', loss='mean_squared_error')

# Fit the model
model.fit(predictors, target)
```

```
17/17 [==============================] - 0s 28ms/step - loss: 119.2932
```

[16]: `<tensorflow.python.keras.callbacks.History at 0x7faad279e850>`

3 Classification models

1. How to compile the classification model with Keras?

- Use `'categorical_crossentropy'` loss function, which is similar to log loss, but lower is better.
- Add `metrics = ['accuracy']` to compile step for easy-to-understand diagnostics.
- The output layer has a separate node for each possible outcome and uses `'softmax'` activation.

2. How to transform the target value into categorical?

shot_clock	dribbles	touch_time	shot_dis	close_def_dis	shot_result
10.8	2	1.9	7.7	1.3	1
3.4	0	0.8	28.2	6.1	0
0	3	2.7	10.1	0.9	0
10.3	2	1.9	17.2	3.4	0

shot_result
1
0
0
0

→

Outcome 0	Outcome 1
0	1
1	0
1	0
1	0

3. Code of classification:

[17]:
```
import pandas as pd
from keras.layers import Dense
from keras.models import Sequential
```

```
def Data_preparation(df):
    df = df.reindex(columns=[
        'SHOT_CLOCK', 'DRIBBLES', 'TOUCH_TIME', 'SHOT_DIST', 'CLOSE_DEF_DIST',
        'SHOT_RESULT'
    ])
    df['SHOT_CLOCK'] = df['SHOT_CLOCK'].fillna(0)
    df['SHOT_RESULT'].replace('missed', 0, inplace=True)
    df['SHOT_RESULT'].replace('made', 1, inplace=True)
    df.columns = df.columns.str.lower()
    return df
```

[18]:
```
from keras.utils.np_utils import to_categorical

data = pd.read_csv('ref5. Basketball shot log.csv')

data = Data_preparation(data)

predictors = data.drop(['shot_result'], axis=1).to_numpy()
n_cols = predictors.shape[1]
target = to_categorical(data.shot_result)

model = Sequential()
model.add(Dense(100, activation='relu', input_shape=(n_cols, )))
model.add(Dense(100, activation='relu'))
model.add(Dense(100, activation='relu'))
model.add(Dense(2, activation='softmax'))
model.compile(optimizer='adam',
              loss='categorical_crossentropy',
              metrics=['accuracy'])

model.fit(predictors, target)
```

```
4003/4003 [==============================] - 8s 2ms/step - loss: 0.6628 -
accuracy: 0.6066
```

[18]:
```
<tensorflow.python.keras.callbacks.History at 0x7faacabea810>
```

4. Practice question for understanding the classification data:

- To start modeling with a new dataset for a classification problem. This data includes information about passengers on the Titanic. The predictors such as `age`, `fare`, and where each passenger embarked to could be used to predict who will survive. This data is from a tutorial on data science competitions. There are descriptions of the features.
- It's smart to review the maximum and minimum values of each variable to ensure the data isn't misformatted or corrupted. What was the maximum age of passengers on the Titanic? Use the `.describe()` method in the IPython Shell to answer this question.

☐ 29.699.

☒ 80.

```

[23]:
```
max_age = int(df['age'].max())
print('The maximum age of passengers on the Titanic is {}.'.format(max_age))
```

```
The maximum age of passengers on the Titanic is 80.
```

5. Practice exercises for classification models:

▶ Package pre-loading:

[24]:
```
import pandas as pd
```

▶ Data pre-loading:

[25]:
```
df = pd.read_csv('ref6. Titanic.csv')

df['age_was_missing'].replace(False, 0, inplace=True)
df['age_was_missing'].replace(True, 1, inplace=True)

predictors = df.drop(['survived'], axis=1).to_numpy()
n_cols = predictors.shape[1]
```

▶ Classification models practice:

[26]:
```
# Import necessary modules
import keras
from keras.layers import Dense
from keras.models import Sequential
from keras.utils import to_categorical

# Convert the target to categorical: target
target = to_categorical(df.survived)

# Set up the model
model = Sequential()

# Add the first layer
model.add(Dense(32, activation='relu', input_shape=(n_cols, )))

# Add the output layer
model.add(Dense(2, activation='softmax'))

# Compile the model
model.compile(optimizer='sgd',
              loss='categorical_crossentropy',
              metrics=['accuracy'])
```

```
# Fit the model
model.fit(predictors, target)
```

```
28/28 [==============================] - 1s 25ms/step - loss: 2.6407 - accuracy:
0.6043
```

[26]: <tensorflow.python.keras.callbacks.History at 0x7faab7ca87d0>

4 Using models

1. How to use models?

- Save.
- Reload.
- Make predictions.

2. Code of saving, reloading, and using the model reloaded:

[27]:
```
import pandas as pd
from keras.layers import Dense
from keras.models import Sequential
from keras.utils.np_utils import to_categorical

data = pd.read_csv('ref5. Basketball shot log.csv')

def Data_preparation(df):
    df = df.reindex(columns=[
        'SHOT_CLOCK', 'DRIBBLES', 'TOUCH_TIME', 'SHOT_DIST', 'CLOSE_DEF_DIST',
        'SHOT_RESULT'
    ])
    df['SHOT_CLOCK'] = df['SHOT_CLOCK'].fillna(0)
    df['SHOT_RESULT'].replace('missed', 0, inplace=True)
    df['SHOT_RESULT'].replace('made', 1, inplace=True)
    df.columns = df.columns.str.lower()
    return df

df = Data_preparation(data)
predictors = df.drop(['shot_result'], axis=1).to_numpy()
n_cols = predictors.shape[1]
target = to_categorical(df.shot_result)

model = Sequential()
model.add(Dense(100, activation='relu', input_shape=(n_cols, )))
model.add(Dense(100, activation='relu'))
model.add(Dense(100, activation='relu'))
```

```
model.add(Dense(2, activation='softmax'))
model.compile(optimizer='adam',
              loss='categorical_crossentropy',
              metrics=['accuracy'])

model.fit(predictors, target)
```

```
4003/4003 [==============================] - 7s 2ms/step - loss: 0.6611 -
accuracy: 0.6074
```

[27]:
```
<tensorflow.python.keras.callbacks.History at 0x7faab7dad110>
```

[28]:
```
from keras.models import load_model

model.save('ref7. Model file.h5')
my_model = load_model('ref7. Model file.h5')

predictions = my_model.predict(predictors)
probability_true = predictions[:, 1]
probability_true
```

[28]:
```
array([0.42297667, 0.30297142, 0.3634744 , …, 0.39298046, 0.38890243,
       0.44359168], dtype=float32)
```

[29]:
```
my_model.summary()
```

```

3. Practice exercises for using models:

▶ Package pre-loading:

[30]:
```
import pandas as pd
from keras.layers import Dense
from keras.models import Sequential
from keras.utils import to_categorical
```

▶ **Data pre-loading:**

[31]:
```
df = pd.read_csv('ref6. Titanic.csv')

df.replace(False, 0, inplace=True)
df.replace(True, 1, inplace=True)

predictors = df.drop(['survived'], axis=1).to_numpy()
n_cols = predictors.shape[1]
target = to_categorical(df.survived)

pred_data = pd.read_csv('ref8. Titanic predictors data.csv')
pred_data.replace(False, 0, inplace=True)
pred_data.replace(True, 1, inplace=True)
```

▶ **Making predictions practice:**

[32]:
```
# Specify, compile, and fit the model
model = Sequential()
model.add(Dense(32, activation='relu', input_shape=(n_cols, )))
model.add(Dense(2, activation='softmax'))
model.compile(optimizer='sgd',
              loss='categorical_crossentropy',
              metrics=['accuracy'])
model.fit(predictors, target)

# Calculate predictions: predictions
predictions = model.predict(pred_data)

# Calculate predicted probability of survival: predicted_prob_true
predicted_prob_true = predictions[:, 1]

# print predicted_prob_true
print(predicted_prob_true)
```

```
