Building Deep Learning Models with Keras

LATEX, Puteaux, 2020, 2021

Table of Contents

- 1 Creating a keras model
- 1.1 [note-1] Model building steps
- 1.2 [code-1] Model specification
- 1.3 [quiz-1] Understanding the data
- 1.4 [task-1] Specifying a model
- 2 Compiling and fitting a model
- 2.1 [note-1] Why need to compile the model
- 2.2 [code-1] Compiling a model
- 2.3 [note-2] What is fitting a model
- 2.4 [code-2] Fitting a model
- 2.5 [task-1] Compiling the model
- 2.6 [task-2] Fitting the model
- 3 Classification models
- 3.1 [note-1] Classification
- 3.2 [note-2] Transforming to categorical
- 3.3 [code-1] Classification
- 3.4 [quiz-1] Understanding the classification data
- 3.5 [task-1] Last steps in classification models
- 4 Using models
- 4.1 [note-1] Using models
- 4.2 [code-1] Saving, reloading, and using the model
- 4.3 [code-2] Verifying model structure
- 4.4 [task-1] Making predictions
- 5 Requirements

1 Creating a keras model

1.1 [note-1] Model building steps

- Specify Architecture
- Compile
- Fit
- Predict

1.2 [code-1] Model specification

1.3 [quiz-1] Understanding the data

- It will be started soon to building models in Keras to predict wages based on various professional and demographic factors by the next steps. Before starting building a model, it's good to understand the data by performing some exploratory analysis.
- It is recommended to use the .head() and .describe() methods in the IPython Shell to quickly overview the DataFrame.
- The target variable which will be predicting is wage_per_hour. Some of the predictor variables are binary indicators, where a value of 1 represents True, and 0 represents False.
- Of the nine predictor variables in the DataFrame, how many are binary indicators? The min and max values, as shown by .describe() will be informative here. How many binary indicator predictors are there?
 - \square 0.
 - \square 5.
 - \boxtimes 6.

► Package pre-loading

```
[2]: import pandas as pd
```

▶ Data pre-loading

```
[3]: df = pd.read_csv('../Datasets/2. Hourly wages.csv')
    ▶ Quiz solution
[4]: df.head()
[4]:
        wage_per_hour

                                                                        1.000000
     max
[6]: cols = df.columns
     count = 0
     for i in range(len(cols)):
         if ((len(df.iloc[:, i].unique()) == 2)
```

There are 6 binary indicator predictors here.

1.4 [task-1] Specifying a model

▶ Package pre-loading

```
[7]: import pandas as pd
```

▶ Data pre-loading

```
[8]: df = pd.read_csv('../Datasets/2. Hourly wages.csv')

target = df.iloc[:, 0].to_numpy()
predictors = df.iloc[:, 1:].to_numpy()
```

► Task practice

```
[9]: # Import necessary modules
from tensorflow.keras.layers import Dense
from tensorflow.keras.models import Sequential

# Save the number of columns in predictors: n_cols
n_cols = predictors.shape[1]

# Set up the model: model
model = Sequential()

# Add the first layer
model.add(Dense(50, activation='relu', input_shape=(n_cols,)))

# Add the second layer
model.add(Dense(32, activation='relu'))

# Add the output layer
model.add(Dense(1))
```

2 Compiling and fitting a model

2.1 [note-1] Why need to compile the model

• Specify the optimizer:

- many options and mathematically complex
- 'adam' is usually a good choice
- Loss function:
 - 'mean_squared_error' common for regression

2.2 [code-1] Compiling a model

2.3 [note-2] What is fitting a model

- Apply backpropagation and gradient descent with the data to update the weights.
- Scaling data before fitting can ease optimization.

2.4 [code-2] Fitting a model

```
17/17 [========= ] - Os 2ms/step - loss: 52.9959
```

[11]: <tensorflow.python.keras.callbacks.History at 0x7f578c047650>

2.5 [task-1] Compiling the model

► Package pre-loading

```
[12]: import pandas as pd
```

▶ Data pre-loading

```
[13]: df = pd.read_csv('../Datasets/2. Hourly wages.csv')
predictors = df.iloc[:, 1:].to_numpy()
```

▶ Task practice

```
[14]: # Import necessary modules
    from tensorflow.keras.layers import Dense
    from tensorflow.keras.models import Sequential

# Specify the model
    n_cols = predictors.shape[1]
    model = Sequential()
    model.add(Dense(50, activation='relu', input_shape=(n_cols, )))
    model.add(Dense(32, activation='relu'))
    model.add(Dense(1))

# Compile the model
    model.compile(optimizer='adam', loss='mean_squared_error')

# Verify that model contains information from compiling
    print("Loss function: " + model.loss)
```

Loss function: mean_squared_error

2.6 [task-2] Fitting the model

▶ Data pre-loading

```
[15]: target = df.iloc[:, 0].to_numpy()
```

► Task practice

```
[16]: # Import necessary modules
from tensorflow.keras.layers import Dense
from tensorflow.keras.models import Sequential

# Specify the model
n_cols = predictors.shape[1]
model = Sequential()
model.add(Dense(50, activation='relu', input_shape=(n_cols, )))
model.add(Dense(32, activation='relu'))
model.add(Dense(1))

# Compile the model
model.compile(optimizer='adam', loss='mean_squared_error')

# Fit the model
```

```
model.fit(predictors, target)
```

```
17/17 [==========] - Os 2ms/step - loss: 485.0336
```

[16]: <tensorflow.python.keras.callbacks.History at 0x7f576c26b2d0>

3 Classification models

3.1 [note-1] Classification

- 'categorical_crossentropy' loss function.
- Similar to log loss:
 - lower is better
- Add metrics = ['accuracy'] to compile step for easy-to-understand diagnostics.
- The output layer has a separate node for each possible outcome and uses 'softmax' activation.

3.2 [note-2] Transforming to categorical

shot_clock	dribbles	touch_time	shot_dis	close_def_ dis	shot_result	shot_result		Outcome 0	Outcome 1
10.8	2	1.9	7.7	1.3	1	1		0	1
3.4	0	0.8	28.2	6.1	0	0	\rightarrow	1	0
0	3	2.7	10.1	0.9	0	0		1	0
10.3	2	1.9	17.2	3.4	0	0		1	0

3.3 [code-1] Classification

```
return df
      data = pd.read_csv('../Datasets/4. Basketball shot log.csv')
      df = data_preparation(data)
      predictors = df.drop(['shot_result'], axis=1).to_numpy()
      n cols = predictors.shape[1]
      target = to_categorical(df.shot_result)
      model = Sequential()
      model.add(Dense(100, activation='relu', input_shape=(n_cols, )))
      model.add(Dense(100, activation='relu'))
      model.add(Dense(100, activation='relu'))
      model.add(Dense(2, activation='softmax'))
      model.compile(optimizer='adam',
                    loss='categorical_crossentropy',
                    metrics=['accuracy'])
      model.fit(predictors, target)
     accuracy: 0.6065
[17]: <tensorflow.python.keras.callbacks.History at 0x7f576c07c210>
     3.4
           [quiz-1] Understanding the classification data
        • To start modeling with a new dataset for a classification problem. This data includes infor-
          mation about passengers on the Titanic. Use predictors such as age, fare, and where each
          passenger embarked from to predict who will survive. This data is from a tutorial on data
          science competitions. Look here for descriptions of the features.
        • It's smart to review the maximum and minimum values of each variable to ensure the data
          isn't misformatted or corrupted. What was the maximum age of passengers on the Titanic?
          Use the .describe() method in the IPython Shell to answer this question.
          \square 29.699.
          \boxtimes 80.
          \square 891.
          \square It is not listed.
```

► Package pre-loading

[18]: import pandas as pd

▶ Data pre-loading

[19]: df = pd.read_csv('../Datasets/5. Titanic.csv')

▶ Quiz solution

```
[20]: df.head()
[20]:
         survived pclass
                                                           male
                                                                  age_was_missing
                              age
