Classification models

Puteaux, Fall/Winter 2020-2021

- §1 Introduction to Deep Learning in Python
- §1.3 Building deep learning models with keras

1 Classification models

1.1 How to compile the classification model with Keras?

- Use 'categorical_crossentropy' loss function, which is similar to log loss, but lower is better.
- Add metrics = ['accuracy'] to compile step for easy-to-understand diagnostics.
- The output layer has a separate node for each possible outcome and uses 'softmax' activation.

1.2 How to transform the target value into categorical?

shot_clock	dribbles	touch_time	shot_dis	close_def_ dis	shot_result	shot_result		Outcome 0	Outcom
10.8	2	1.9	7.7	1.3	1	1		0	1
3.4	0	0.8	28.2	6.1	0	0	—	1	0
0	3	2.7	10.1	0.9	0	0		1	0
10.3	2	1.9	17.2	3.4	0	0		1	0

1.3 Code of classification:

```
[1]: import pandas as pd
from keras.layers import Dense
from keras.models import Sequential
```

[2]: <tensorflow.python.keras.callbacks.History at 0x7ffa33dd96d0>

1.4 Practice question for understanding the classification data:

- To start modeling with a new dataset for a classification problem. This data includes information about passengers on the Titanic. The predictors such as age, fare, and where each passenger embarked to could be used to predict who will survive. This data is from a tutorial on data science competitions. There are descriptions of the features.
- It's smart to review the maximum and minimum values of each variable to ensure the data isn't misformatted or corrupted. What was the maximum age of passengers on the Titanic? Use the .describe() method in the IPython Shell to answer this question.

```
\square 29.699.
          \boxtimes 80.
          □ 891.
          \square It is not listed.
    ▶ Package pre-loading:
[3]: import pandas as pd
    ▶ Data pre-loading:
[4]: df = pd.read_csv('ref6. Titanic.csv')
    ▶ Question-solving method:
[5]: df.head()
[5]:
        survived pclass
                              age
                                   sibsp
                                           parch
                                                       fare
                                                             male
                                                                    age_was_missing
                                                                               False
     0
                0
                             22.0
                                                    7.2500
                                                                 1
     1
                1
                             38.0
                                        1
                                              0
                                                   71.2833
                                                                               False
                                                                 0
     2
                1
                         3
                             26.0
                                        0
                                                0
                                                    7.9250
                                                                 0
                                                                               False
     3
                1
                         1
                             35.0
                                        1
                                                0
                                                   53.1000
                                                                 0
                                                                               False
                0
                         3
                            35.0
                                        0
                                                0
                                                    8.0500
                                                                 1
                                                                               False
        embarked_from_cherbourg
                                    embarked_from_queenstown

     2
                                   1
     3
                                    1
     4
                                   1
[6]: df['age'].describe()
               891.000000
[6]: count
     mean
                29.699118
     std
                13.002015
     min
                 0.420000
     25%
                22.000000
     50%
                29.699118
     75%
                35.000000
```

```
max 80.000000
Name: age, dtype: float64

[7]: max_age = int(df['age'].max())
print('The maximum age of passengers on the Titanic is {}.'.format(max_age))
```

The maximum age of passengers on the Titanic is 80.

- 1.5 Practice exercises for classification models:
- ▶ Package pre-loading:

```
[8]: import pandas as pd
```

► Data pre-loading:

```
[9]: df = pd.read_csv('ref6. Titanic.csv')

df['age_was_missing'].replace(False, 0, inplace=True)

df['age_was_missing'].replace(True, 1, inplace=True)

predictors = df.drop(['survived'], axis=1).to_numpy()
n_cols = predictors.shape[1]
```

▶ Classification models practice:

```
[10]: # Import necessary modules
     import keras
     from keras.layers import Dense
     from keras.models import Sequential
     from keras.utils import to_categorical
     # Convert the target to categorical: target
     target = to_categorical(df.survived)
     # Set up the model
     model = Sequential()
     # Add the first layer
     model.add(Dense(32, activation='relu', input_shape=(n_cols, )))
     # Add the output layer
     model.add(Dense(2, activation='softmax'))
     # Compile the model
     model.compile(optimizer='sgd',
                    loss='categorical_crossentropy',
                    metrics=['accuracy'])
```

```
# Fit the model
model.fit(predictors, target)
```
