Building deep learning models with keras

Puteaux, Fall/Winter 2020-2021

1 Creating a keras model

1. What are the model-building steps?

- The Keras workflow has four steps:
 - specify Architecture
 - compile
 - fit
 - predict

2. Code of model specification:

3. Practice question for understanding the data:

- It will be started soon to building models in Keras to predict wages based on various professional and demographic factors by the next steps. Before starting building a model, it's good to understand the data by performing some exploratory analysis.
- It is recommended to use the .head() and .describe() methods in the IPython Shell to quickly overview the DataFrame.
- The target variable which will be predicting is wage_per_hour. Some of the predictor variables are binary indicators, where a value of 1 represents True, and 0 represents False.
- Of the nine predictor variables in the DataFrame, how many are binary indicators? The min and max values, as shown by .describe() will be informative here. How many binary indicator predictors are there?
 - \square 0.
 - \square 5.
 - \boxtimes 6.

▶ Package pre-loading:

```
[2]: import pandas as pd
```

▶ Data pre-loading:

```
[3]: df = pd.read_csv('ref2. Hourly wages.csv')
```

▶ Question-solving method:

```
[4]: df.head()
```

                                                       1.000000
     max
[6]: cols = df.columns
     count = 0
     for i in range(len(cols)):
         if ((df.iloc[:, i].unique()[0] in [0, 1])
                 and (df.iloc[:, i].unique()[1] in [0, 1])):
             count += 1
         else:
             pass
     print('There are {} binary indicator predictors here.'.format(count))
```

There are 6 binary indicator predictors here.

- 4. Practice exercises for creating a Keras model:
- ▶ Package pre-loading:

```
[7]: import pandas as pd
```

▶ Data pre-loading:

```
[8]: df = pd.read_csv('ref2. Hourly wages.csv')

target = df.iloc[:, 0].to_numpy()
predictors = df.iloc[:, 1:].to_numpy()
```

▶ Model specifying practice:

```
[9]: # Import necessary modules
import keras
from keras.layers import Dense
from keras.models import Sequential

# Save the number of columns in predictors: n_cols
```

```
n_cols = predictors.shape[1]

# Set up the model: model
model = Sequential()

# Add the first layer
model.add(Dense(50, activation='relu', input_shape=(n_cols, )))

# Add the second layer
model.add(Dense(32, activation='relu'))

# Add the output layer
model.add(Dense(1))
```

2 Compiling and fitting a model

1. Why is it necessary to compile the model?

- Specify the optimizer:
 - many options and mathematically complex
 - adam is usually a good choice
- Loss function:
 - mean_squared_error is common for regression

2. Code of compiling a model:

3. What is fitting a model?

- Apply backpropagation and gradient descent with the data to update the weights.
- Scale data before fitting can ease optimization.

4. Code of fitting a model:

```
[11]: target = np.loadtxt('ref3. Hourly wages target data.csv', delimiter=',')
model.fit(predictors, target)
```

- [11]: <tensorflow.python.keras.callbacks.History at 0x7fe9715de0d0>
 - 5. Practice exercises for compiling and fitting a model:
 - ► Package pre-loading:

```
[12]: import pandas as pd
```

► Data pre-loading:

```
[13]: df = pd.read_csv('ref2. Hourly wages.csv')
predictors = df.iloc[:, 1:].to_numpy()
```

► Model compiling practice:

```
[14]: # Import necessary modules
import keras
from keras.layers import Dense
from keras.models import Sequential

# Specify the model
n_cols = predictors.shape[1]
model = Sequential()
model.add(Dense(50, activation='relu', input_shape=(n_cols, )))
model.add(Dense(32, activation='relu'))
model.add(Dense(1))

# Compile the model
model.compile(optimizer='adam', loss='mean_squared_error')

# Verify that model contains information from compiling
print("Loss function: " + model.loss)
```

Loss function: mean_squared_error

▶ Data re-pre-loading:

```
[15]: target = df.iloc[:, 0].to_numpy()
```

▶ Model fitting practice:

```
[16]: # Import necessary modules import keras
```

```
from keras.layers import Dense
from keras.models import Sequential

# Specify the model
n_cols = predictors.shape[1]
model = Sequential()
model.add(Dense(50, activation='relu', input_shape=(n_cols, )))
model.add(Dense(32, activation='relu'))
model.add(Dense(1))

# Compile the model
model.compile(optimizer='adam', loss='mean_squared_error')

# Fit the model
model.fit(predictors, target)
```

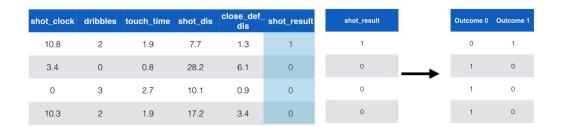

[16]: <tensorflow.python.keras.callbacks.History at 0x7fe971d323d0>

3 Classification models

1. How to compile the classification model with Keras?

- Use 'categorical_crossentropy' loss function, which is similar to log loss, but lower is better.
- Add metrics = ['accuracy'] to compile step for easy-to-understand diagnostics.
- The output layer has a separate node for each possible outcome and uses 'softmax' activation

2. How to transform the target value into categorical?

3. Code of classification:

```
[17]: import pandas as pd
from keras.layers import Dense
from keras.models import Sequential
```

[18]: <tensorflow.python.keras.callbacks.History at 0x7fe969beb190>

4. Practice question for understanding the classification data:

- To start modeling with a new dataset for a classification problem. This data includes information about passengers on the Titanic. The predictors such as age, fare, and where each passenger embarked to could be used to predict who will survive. This data is from a tutorial on data science competitions. There are descriptions of the features.
- It's smart to review the maximum and minimum values of each variable to ensure the data isn't misformatted or corrupted. What was the maximum age of passengers on the Titanic? Use the .describe() method in the IPython Shell to answer this question.

```
\square 29.699.
           ⊠ 80.
           \square 891.
           \square It is not listed.
      ▶ Package pre-loading:
[19]: import pandas as pd
      ▶ Data pre-loading:
[20]: df = pd.read_csv('ref6. Titanic.csv')
      ▶ Question-solving method:
[21]: df.head()
          survived pclass
                                    sibsp
[21]:
                                                              male
                               age

```

```
[23]: max_age = int(df['age'].max())
print('The maximum age of passengers on the Titanic is {}.'.format(max_age))
```

The maximum age of passengers on the Titanic is 80.

- 5. Practice exercises for classification models:
- ▶ Package pre-loading:

```
[24]: import pandas as pd
```

▶ Data pre-loading:

```
[25]: df = pd.read_csv('ref6. Titanic.csv')

df['age_was_missing'].replace(False, 0, inplace=True)

df['age_was_missing'].replace(True, 1, inplace=True)

predictors = df.drop(['survived'], axis=1).to_numpy()
n_cols = predictors.shape[1]
```

▶ Classification models practice:

```
[26]: # Import necessary modules
      import keras
      from keras.layers import Dense
      from keras.models import Sequential
      from keras.utils import to_categorical
      # Convert the target to categorical: target
      target = to categorical(df.survived)
      # Set up the model
      model = Sequential()
      # Add the first layer
      model.add(Dense(32, activation='relu', input_shape=(n_cols, )))
      # Add the output layer
      model.add(Dense(2, activation='softmax'))
      # Compile the model
      model.compile(optimizer='sgd',
                    loss='categorical_crossentropy',
                    metrics=['accuracy'])
```

```
# Fit the model
model.fit(predictors, target)
```

[26]: <tensorflow.python.keras.callbacks.History at 0x7fe956cacd10>

4 Using models

- 1. How to use models?
 - Save.
 - Reload.
 - Make predictions.
- 2. Code of saving, reloading, and using the model reloaded:

```
[27]: import pandas as pd
      from keras.layers import Dense
      from keras.models import Sequential
      from keras.utils.np_utils import to_categorical
      data = pd.read_csv('ref5. Basketball shot log.csv')
      def data_preparation(df):
          df = df.reindex(columns=[
              'SHOT_CLOCK', 'DRIBBLES', 'TOUCH_TIME', 'SHOT_DIST', 'CLOSE_DEF_DIST',
              'SHOT RESULT'
          ])
          df['SHOT_CLOCK'] = df['SHOT_CLOCK'].fillna(0)
          df['SHOT_RESULT'].replace('missed', 0, inplace=True)
          df['SHOT_RESULT'].replace('made', 1, inplace=True)
          df.columns = df.columns.str.lower()
          return df
      df = data_preparation(data)
      predictors = df.drop(['shot_result'], axis=1).to_numpy()
      n_cols = predictors.shape[1]
      target = to_categorical(df.shot_result)
      model = Sequential()
      model.add(Dense(100, activation='relu', input_shape=(n_cols, )))
      model.add(Dense(100, activation='relu'))
      model.add(Dense(100, activation='relu'))
```

```
model.add(Dense(2, activation='softmax'))
    model.compile(optimizer='adam',
               loss='categorical_crossentropy',
               metrics=['accuracy'])
    model.fit(predictors, target)
    4003/4003 [============== ] - 10s 2ms/step - loss: 0.6653 -
    accuracy: 0.6066
